Major Issues and Concerns

1. Methodology approach underdeveloped

- A more explicit problem statement with real-world fraud statistics in nonprofits would contextualize the importance of the work.

TO-DO: Develop explicit problem statement with real-world fraud statistics in nonprofits

- I suggest the authors consider implementing a Design Science Methodology, as there are several excellent examples in the Accounting literature (Peffer *et al.*, 2007; Geerts, 2011; Myers *et al.*, 2024; Wang, Chiu and Vasarhelyi, 2025).

TO-DO: Implement—not simply reformat according to a template—a Design Science Methodology. Weigh and plan carefully so as to retain structure of reviewed draft, while implementing DSM

2. Limited empirical validation (Tech Readiness Level [TRL] 3).

The system is still in the proof-of-concept phase. Evidence of real-world deployments, user testing, or cross-organizational benchmarking is lacking. The performance metrics (e.g., 85% accuracy) require deeper methodological reporting.

TO-DO: Provide evidence of real-world deployments

TO-DO: Provide evidence of user testing

TO-DO: Provide evidence of cross-organizational bench-marking

7. Training dependency on individual bookkeeper behavior

TO-DO: Clarify capability of Training to avoid dependency on transient individual behavior

- #### 8. Because the baseline churn profile is tied to an individual's habits, turnover or role changes may require significant retraining. The manuscript should discuss mitigation strategies for this operational challenge.

TO-DO: Clarify the built-in simplicity of retraining to mitigate change of individual's habits, turnover or role changes

9. Insufficient analysis of error rates.

While the alert framework is well structured, the manuscript does not provide detailed evaluation of false positives, false negatives, or system robustness across edge cases.

Reviewer's Revision Agenda

Tara =

TO-DO: Respond with a detailed “Triage vocabulary” to replace false positives/negatives, as applied to the churn persistence index (CPI) for presence-absence and the weighted CPI (wCPI) for dollar amounts.

DONE: Cursor-generated draft: NGAME_Glossary_Three_Layer_Terminology.pdf. Draft only, far too dense for final submission, even with our re-write.

10. Complexity may challenge low-resource organizations.

Although users interact with simplified alerts, system setup, maintenance, and customization require technical proficiency. The authors should discuss strategies for long-term sustainability, support, and onboarding.

TO-DO: Cite existing “NGAME—Implementation Guide” (the READ-ME at <http://github.com/ronalddc-turner/ngame>). Cite clear requirement for technical competence for setup, maintenance and customization. Describe realistic level of effort and total cost of ownership required for the tech and for the financially responsible person (FRP).
